

Warning

this is no place for a leaky pump.

If you've got corrosives, pollutants, or toxics to pump, you really should consider upgrading to Goulds sealless process pumps. Our metal (Model 3296) and ETFE-lined (Model 3298) magnetic drive pumps are designed for optimum performance and emission prevention. Goulds Dryguard™ bearings will ensure safe operation through short-term dry run conditions—the main cause of magnetic drive pump failure. And for the ultimate in protection, the ITT PumpSmart® controller has the ability to monitor, rapidly identify process upset conditions, and react to protect your mag-drive pump. One more reason ITT should be your choice for all critical pumping needs. Call 1-800-734-7867 or visit gouldspumps.com for more information.
